We demonstrate the preparation of defect-free patterns of single Sr atoms in optical tweezers. The Sr atoms form the qubit register of our programmable Rydberg quantum simulator. This platform is highly suitable to study for example large scale spin-1/2 systems or spin squeezing. The qubit states are encoded onto two electronic levels of the atoms. The qubits are selectively read-out using fluorescence imaging on the narrow $S_{1/2} - P_{1/2}$ transition with 99.9% [1] W.J. Eckner, et al., pre-print: ArXiv:2303.08078

Primary author: SPREEUW, Robert (University of Amsterdam)

Presenter: SPREEUW, Robert (University of Amsterdam)

Session Classification: Poster Session II

Track Classification: Quantum Simulation with Single Atom Resolution
